Using its expertise in mobile DSP and music software development, Yonac Software delivers you a versatile new chromatic tuner.

Coming as the culmination of year's painstaking research, PitchBot is a chromatic tuner designed with string instruments in mind. PitchBot's tuning prowess is in its custom-made algorithms to capture, measure and interpret audio data. Whether you use it as a guitar tuner, a mandolin tuner or a cello tuner, PitchBot delivers quick and accurate readings, even in the noisiest environments.

Recognizing the needs of musicians, PitchBot balances ease-of-use with a versatile feature set. It includes dual tone readouts, built-in RMS amplitude measurement, adjustable reference pitch and transposition, all clearly and intelligibly laid out.

Best yet, it is available at a fraction of the cost of its competitors. We believe that PitchBot will be a good bang for your buck. Try it and see.
